## I Claim:

- 1. A rotor disc for use in an electrical machine has at least one circumferential rotor rim mounted thereon, the rotor rim comprising at least one row of alternate magnets
- 5 and laminated pole pieces, the laminations in each pole piece being supported by at least one bolt which extends through the rotor disc, a clearance gap being provided to electrically insulate the laminations from the bolt passing therethrough.
- 10 2. A rotor disc as claimed in claim 1 in which the clearance is provided by mounting the laminations concentrically on the bolt in a radially spaced relationship.
  - 3. A rotor disc as claimed in claim 1 in which the laminations are bonded together to form a stack.
- 15 4. A rotor disc as claimed in claim 3 in which the stack of bonded laminations is mounted concentrically on the bolt in a radially spaced relationship by the provision of annular members which are insulated at either end of the stack.
  - 5. A rotor disc as claimed in claim 4 in which the insulated annular members are recessed into either end of the stack.
    - 6. A rotor disc as claimed in claim 4 in which the insulated annular members are resilient.
- 7. A rotor disc as claimed in claim 6 in which the annular members are formed from an elastomeric material.
  - 8. A rotor disc as claimed in claim 1 in which means are provided on the bolt for compressing the laminated pole pieces.
- 9. A rotor disc as claimed in claim 8 in which the means for compressing the laminated pole pieces is resilient to maintain the correct compressive force on the laminated pole pieces throughout operation.
- 10. A rotor disc as claimed in claim 9 in which the means for compressing the laminated pole pieces are nuts and sprung washers.
